

Dr Meren Kaur Basra

BDS, MFDS RCS (Ed), PgCert Clinical Education

Meren graduated from the University of Birmingham in 2017. From here she carried out her postgraduate training in hospitals, focusing on oral surgery and oral medicine. She progressed to speciality oral surgery roles, performing surgical extractions and soft tissue procedures. Meren has completed numerous research and audit projects, having presented her work both nationally and internationally as well as having her work published in the prestigious British Journal of Oral Maxillofacial Surgery. Meren also works at Birmingham Dental Hospital as a Specialty Dentist in Oral Surgery and is involved with teaching dentists. She provides treatment for patients on referral who require complex extractions.

Oral Surgery Referrals

Station House Dental Practice

What is Oral Surgery?

Oral surgery refers to any dental procedure performed within the mouth with specific regard to the teeth, jaws, and soft tissues. These procedures can be performed by your general dentist; however, some cases or procedures require expert input in a hospital or clinical setting. Oral surgery can be performed in general dental practice, under local anaesthetic, if suitable.

Why have I been referred?

There are some treatments which your general dental practitioner or orthodontist may not have the experience to perform, or which require specialist knowledge and expertise. These may include:

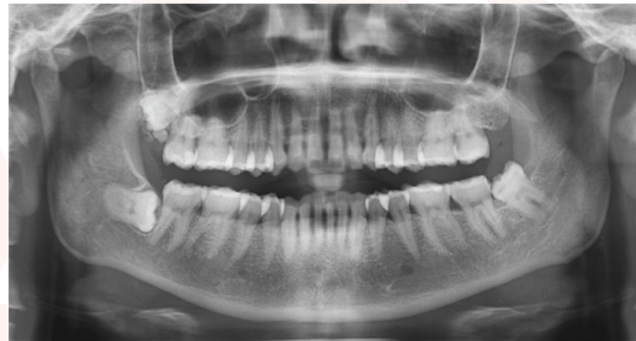

- complex dental extractions
- wisdom tooth removal
- coronectomies
- frenectomies
- expose and bond of impacted teeth

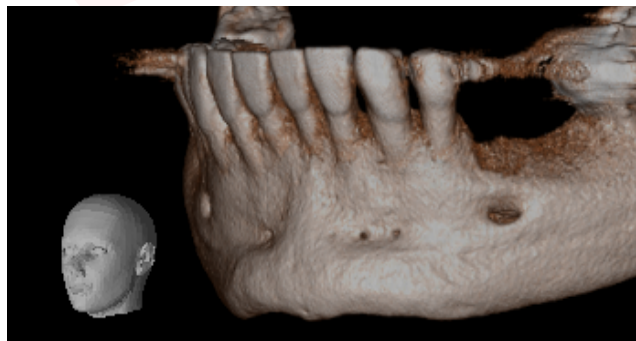

What should I expect at the first appointment?

Following a referral from your dentist or orthodontist, you will be booked for a consultation. The aim of this visit is to clinically assess, diagnose and create the most appropriate treatment plan.

If required during this visit you may be sent for an OPT (x-ray) or CBCT (ct-scan). These images are used as an adjunct to the clinical examination, to help plan and gauge complexity of treatment.

OPT Radiograph

CBCT Scan

What is the fee for the first appointment?

The assessment fee is £60, and this includes any necessary x-rays and photographs. Your report will outline the treatment options including the associated costs.

The examination should feel like when your dentist or hygienist checks your mouth, but the offending tooth may be tender.

How long is the first appointment?

The initial assessment will take approximately 15-20 minutes. If you have been sent for a CBCT scan there may be a second review appointment arranged to discuss the scan findings and treatment options, with no additional charge.

What can I expect following my treatment?

The oral surgery dentist will discuss the possible risks specific to your case. However common post operative; pain, swelling and bruising can be expected, and tends to last and improve up to 3-5 days following the procedure.

Following your treatment, you can take yourself home unless advised otherwise. You will normally be discharged back to your referring dentist, unless you require a review appointment depending on the complexity of your treatment.
